

To discover unauthorized or unconfigured ONUs (also known as "autofind" ONUs) on the ZTE ZXA10 C600, you must walk the **Unconfigured ONU Table** (zxAnPonSrvUnconfOnuTable). For modern ZTE OLTs like the C600, these management objects are located under the **1.3.6.1.4.1.3902.1082.500** (zxAnPon) subtree 1, 2.

SNMP OID for Discovery

The primary OID used to identify waiting ONUs is the **Serial Number** entry within the unconfigured table. Walking this OID will return the serial numbers of all ONUs that have been detected by the PON ports but have not yet been authorized.

- **ONU Serial Number (zxAnPonSrvUnconfOnuSn):**
1.3.6.1.4.1.3902.1082.500.10.2.2.1.2 2

Table Indexing

The table is indexed by two values:

1. **ifIndex:** The Type 1 physical interface index of the PON port (as calculated in our previous discussion) 2.
2. **zxAnPonSrvUnconfOnuIndex:** A local sequence index for the unconfigured ONUs detected on that specific port 2.

Other Useful OIDs for Unconfigured ONUs

Once you have discovered an ONU via its serial number, you can query these related OIDs in the same table to gather more identifying information:

Managed Object,OID Path,Description

ONU Password,1.3.6.1.4.1.3902.1082.500.10.2.2.1.3,The registration password of the ONU 2.

ONU Type,1.3.6.1.4.1.3902.1082.500.10.2.2.1.8,"The hardware model/type detected (e.g., F660) 3."

Software Version,1.3.6.1.4.1.3902.1082.500.10.2.2.1.10,The current firmware version running on the ONU 3.

Hardware Version,1.3.6.1.4.1.3902.1082.500.10.2.2.1.11,The hardware version of the detected device 3.

First Online Time,1.3.6.1.4.1.3902.1082.500.10.2.2.1.12,When the OLT first detected this specific ONU 3.

Example Walk Results

If you perform an SNMP walk on the serial number OID, you might receive a response like this:1.3.6.1.4.1.3902.1082.500.10.2.2.1.2.285278465.1 = STRING: "ZTEGC000ABCD"

In this example:

- 285278465 is the ifIndex for Slot 1, Port 1.
- 1 is the zxAnPonSrvUnconfOnuIndex (the first unconfigured ONU on that port).
- "ZTEGC000ABCD" is the Serial Number waiting for authorization.

Would you like the OIDs for the SNMP Set operations required to authorize one of these discovered ONUs?
